10. PERFORMANCE OF SOUTH AFRICAN CHEVON INDUSTRY IN 2016 .......................................................... 20 
11. ACKNOWLEDGEMENTS/REFERENCES ........................................................................................................ 29
1. DESCRIPTION OF THE INDUSTRY

South Africa is a relatively small goat producing country and possesses only approximately 3% of Africa’s goats and less than 1% of the world’s number of goats. The Boer goat, Savanna and Kalahari Red are currently recognized as commercial goat breeds for the production of meat and skins and small quantities of cashmere. Goat meat is often called chevon when from adults and cabrito when from young animals. Angora goats produce mohair. Saanen, Toggenburg and Alpine goats are mainly kept for milk production. Goat’s milk is highly priced because of its quality and is less prone to causing allergies in humans than cow’s milk. Gorno Altai goats produce cashmere. Indigenous goats refer to various goat types that are in the hands of small-scale producers and contribute primarily to family needs for meat and to a lesser extent for milk, depending on the prejudices of the community.

There are only 250 stud breeders in the country. The US Department of Agriculture (USDA) maintain that the Boer Goat, which is indigenous to South Africa, has better meat in terms of quality and quantity than any other type of goat and small stock. The Boer goat’s meat contains less fat, fewer calories and higher levels of protein and iron than beef, pork, and mutton and broiler meat. White commercial farmers mainly own Boer goats and Angora goats while black farmers mainly own indigenous goats in a communal farming system. Indigenous goats represent approximately 65% of the goats found in South Africa and in the past, they were not subjected to any selection process, are un-improved and are a crossbreeding of the improved goats like the Boer goat, the Kalahari Red and the Savanna goat.

The indigenous goat is mainly found in the Eastern Cape province and also in the Limpopo, North West and KwaZulu-Natal provinces (with small numbers in the other provinces of South Africa). The indigenous goat is neither regarded as a meat goat (due to its small carcass) nor it is regarded as a milk goat (because it gives barely enough milk to provide for the needs of their kids) (NAMC).

Figure 1 below show the gross value of chevon production from 2006/07 to 2015/16.

![Figure 1: Gross value of goat production](image-url)

Source: Statistics and Economic Analysis, Levyadmin and Quantec
The gross value of chevon (goat meat) production is dependent on the quantity produced and prices received by producers during the period under review. The average gross value of chevon produced amounted to R314 million per annum for the past ten years. The gross value of chevon has been increasing throughout the period under review. The gross value of chevon experienced a sharp increase from 2006/07 to 2015/16 which was pushed by a high increase of the price per kg of chevon. Generally, the gross value of chevon increased by 257% during 2015/16 compared to 2006/07.

1.1 PRODUCTION AREAS

Goats are found throughout the country with Eastern Cape, Limpopo and KwaZulu-Natal provinces being the largest producers, accounting for approximately 70% of the total live goats.

Distribution of live goats per province in 2016 is illustrated in Figure 2.

![Figure 2: Provincial distribution of live goats in 2016](image)

Source: Statistics and Economic Analysis, DAFF

Figure 2 shows that the Eastern Cape owns more goats in South Africa accounting for 39% of the total flock followed by Limpopo, KwaZulu–Natal and North West taking up 18%, 13% and 12% respectively. The mentioned four provinces account to a total of 82% and the other five provinces share the remaining 18%.

1.2 Production trends

Goat produces meat and milk but the primary reason for keeping goats is for meat. This contributed in meat goats constituting the major proportion of the world goat population. Chevon is also derived from male goat kids and culls from angora and milch goat herds. Where other goat products such as cheese and cashmere are either primary or secondary products, the culling of goats is influenced by the economic value of these.
Figure 3 below show the goat slaughtered from 2006/07 and 2015/16.

Source: Statistics and Economic Analysis, DAFF

Figure 3 above shows that slaughtering has been increasing from 2006/07 to 2015/16. In 2009/10, there was a higher increase in goat slaughtering. Over the past ten years, the average number of goats slaughtered was 792 758 goats per annum. The peak was reached during 2015/16 with approximately 823 108 goat slaughtered. The figure shows that the goat slaughtering increased by 7% in 2015/16 as compared to 2006/07 marketing period.

Figure 4 below shows the production and consumption of chevon meat from 2007 to 2016. The data for chevon is limited to trace due to informal transactions as its more produced and consumed in areas where producers do not keep records.

Source: Statistics and Economic Analysis, DAFF

It is clear from the figure that during the period review, production of chevon is slightly higher than consumption with less than 1%, except in 2008. This indicates that South Africa is self-sufficient with chevon meat. The trends show that production and consumption of chevon have been increasing for the past decade. The figure
shows a 7% increase in both production and consumption of chevon from 2007 to 2016. The peak has been reached in 2016 with 10 814 tons for both production and consumption.

2. MARKET STRUCTURE

2.1. DOMESTIC MARKET AND PRICES

Goats are mostly slaughtered for religious or traditional purposes and on an informal basis (backyard slaughter). In other words, goats are slaughtered in a specific way for bridal ceremonies and the eating of the meat is restricted to certain persons according to the custom of the families. Goats are also important in burial rituals by traditional healers where they have to suck the blood and wear the gall bladder as a headdress.

Goats slaughtered in the commercial sector are mainly Boer goats and surplus Angora goats. Hence, it is estimated that only 0.55% of the goat is slaughtered in the commercial sector and is mainly marketed in the informal sector (SÁMIC). Goat slaughtering figures are normally included in the slaughter figures for sheep and it is difficult to obtain official statistics on goat slaughtering. Although rarely retailed, chevon is widely eaten in South Africa. Figure 4 shows the local prices of chevon.

Figure 4 shows the local average price of chevon received by producers per carcass in South Africa. The local average prices of chevon have been increasing from 2006/07 to 2015/16 except in 2012/13 were the price has shown a slight decrease. The increase may be the results of changes in demand and preferences of consumers. The average price reached its peak in 2015/16 at R1 029 per carcass. The trend shows that the price of chevon increased by 148% from 2015/16 compared to 2006/07.

2.2. PROCESSING
South Africa has an active and well-developed industry for processing animal products. However, little processing for chevon occurs. Sometimes processors replace mutton with chevon in products such as sausages and polonies when the price of mutton is too high.

2.3. IMPORT – EXPORT ANALYSIS OF CHEVON

Figure 5 compares quantities of imports and exports for chevon from 2007 to 2016.

![Figure 5: Exports and Imports quantities of chevon](image)

Source: Quantec Easydata

Figure 5 indicate that there were some intermittent imports of chevon during the past decade. There were no imports of chevon records during 2008 to 2009 and 2016 while the exports of chevon were recorded continuously throughout the decade. South African imports of chevon were higher than exports only in 2007 reaching maximum of 7 673 kilograms. South Africa exported during the entire period under analysis. This indicates that South Africa was self-sufficient in chevon production during the mentioned periods. The figure indicates the steady decline of exports from 2013 to 2015, and then in 2016 the exports picked up and increased by 115%.

2.4. EXPORTS OF CHEVON

Figure 6 below shows the export destinations of South African chevon in 2016. From Figure 6, Lesotho commanded the greatest share of South Africa's chevon accounting for 85% of the exports in 2016, followed by Seychelles and Zambia with 10% and 5% respectively.
Figure 7 below shows the annual chevon export quantity and value for the period 2007 to 2016.

Figure 7 illustrates that exports of chevon from South Africa were very low in quantity from 2007 and 2010. Both value and quantity have been fluctuating for the past decade. The export value followed the same trend of the quantity. Despite values of 2011 and 2013, the values of chevon exports were higher from 2007 to 2016. This accentuates that it was profitable to export chevon meat during these years. South Africa exported chevon to a total of 43 tons of chevon at a value of R2.7 million during 2016, thus an increase of 115% and 87% respectively from 2015 to 2016.

Chevon exports from various provinces of South Africa from 2007 to 2016 are shown from Figure 8 to 14.
Figure 8 presents the value of chevon exports by South African Provinces between 2007 and 2016.

Provincial exports of chevon were recorded in five Provinces for the past decade. Gauteng Province dominated the chevon export market and recorded high values of chevon during the periods 2007 to 2014. Noteworthy is the fact that Gauteng is holding less than 1% of live goats but exports are higher than all other provinces. This may be due to the fact that Gauteng is one of the main exit for exports of chevon meat. Irregular exports were experienced in the Western Cape, KwaZulu-Natal, Free State and Mpumalanga provinces. Free State has shot up its exports and outstripped Gauteng Province in 2015 and 2016. Mpumalanga recorded the exports of chevon only in 2009 and 2012 at approximately R 379 626 and R19 306 respectively. The figure further show that Gauteng recorded minimum value of chevon exports in 2015 whereas maximum value of chevon was recorded in 2014 at approximately R1.8 million. There was a drastic decline of 97% in the value of chevon exports from Gauteng Province in 2015 as compared to 2014 marketing season. However, the province picked up in 2016.

Figure 9 presents the value of chevon exports by Gauteng Province between 2007 and 2016.
In Gauteng province, exports of chevon were mainly from the City of Johannesburg Metropolitan followed by Ekurhuleni and City of Tshwane Metropolitan Municipalities. City of Johannesburg Metropolitan Municipality has been recording the highest exports from 2007 to 2015, and in 2016, City of Tshwane took over the lead. The highest export value was recorded in 2014 from City of Johannesburg Metropolitan Municipality. Ekurhuleni did not record any exports of chevon only in 2007. City of Johannesburg Metropolitan Municipality was the only municipality in Gauteng Province which recorded regular exports of chevon during the past decade. There was drastic decline of 97% in the value of chevon exports from City of Johannesburg Metropolitan Municipality in Gauteng Province in 2015 as compared to 2014 marketing season, and in 2016, the municipality increase its exports by 414%.

Figure 10 presents the value of chevon exports by Free State Province between 2007 and 2016.

Figure 10 show that Free State Province did not export chevon meat from 2007 to 2013. Mangaung and Lejweleputswa District Municipalities recorded chevon exports only in 2014 and 2016 respectively, whilst Thabo Mofutsanyane District Municipality recorded exports of chevon meat from 2015 to 2016 with highest export...
value of R1.39 million and R1.9 million respectively. In 2016, Thabo Mofutsanyane and Lejweleputswa recorded 99% and 1% share of chevon exports respectively. Figure 12 presents the value of chevon exports by Mpumalanga Province between 2007 and 2016.

Figure 12: Value of chevon exports from Mpumalanga Province

Source: Quantec Easydata

Figure 12 above shows that intermittent exports of chevon in Mpumalanga were from Gert Sibande District Municipality, which recorded exports only in 2009 and 2012 and diminished during the other years. The figure further shows that Gert Sibande District Municipality attained peak of R379 626 in 2009. There was 100% decline in the value of exports in 2013 to 2016 as compared to 2012 marketing season. Figure 13 shows the value of chevon exports by Western Cape Province between 2007 and 2016.

Figure 13: Value of chevon exported from Western Cape Province

Source: Quantec Easydata

The figure shows that the exports of chevon meat from the Western Cape Province were mainly from the City of Cape Town Metropolitan Municipality. There were no exports records for chevon in Western Cape Province from 2007 to 2009 and 2011. The figure further shows that the value of chevon exports from City of Cape Town Metropolitan Municipality attained peak of R 213 100 in 2014. There was drastic decline of 97% in the value of chevon exports from City of Cape Town Metropolitan Municipality in 2015 as compared to 2014 marketing season. However, the exports picked up by 401% in 2016. Figure 14 shows the value of chevon exports by KwaZulu-Natal Province between 2007 and 2016.
From KwaZulu-Natal Province, the exports were mainly from eThekwini Metropolitan Municipality. The figure show that there were no exports of chevon from 2007 to 2009, 2011 to 2012 and 2015 to 2016 at eThekwini Metropolitan Municipality. The value of chevon exports were recorded in 2010, 2013 and 2014. The value of exports of chevon from eThekwini Metropolitan Municipality reached its peak of R256 402 in 2014.

2.5. IMPORTS OF CHEVON

South Africa mainly imports fresh, chilled or frozen carcasses of goats, fresh, chilled or frozen cuts with bone in of goats and fresh, chilled or frozen boneless goat meat. During the period 2007 to 2016 South Africa imported an average of 6 217 kilograms of chevon per annum yielding an average R83 139 per annum. Figure 14 shows the imports of chevon from the period 2007 to 2016.
Figure 14 shows that imports of chevon by South Africa were intermittent but the new peak was reached in 2013 after the previous peak in 2011. It is clear that it was not profitable to import chevon in 2010 and from 2012 to 2015 as compared to 2007 and 2011 since more quantity were imported with less value. There were no records of imports during the periods between 2008 – 2009 and in 2016.

3. MARKETING CHANNELS / GOAT VALUE CHAIN

The indigenous goat industry is not organised in the form of provincial and national structures. Nevertheless, a very effective marketing system with the assistance of traders / speculators for indigenous goats has developed over many years. Due to the demand for goats in the informal market and the shortage of goats, farmers are getting good prices.

The majority of goats marketed in South Africa are sold by private transactions in the informal market to be slaughtered for religious or traditional purposes. The result is that a very small percentage of goats are marketed through registered abattoirs. The informal market of goats through traders or speculators therefore drives the South African goat industry.

Figure 15: Marketing channels of goats and chevon in South Africa

Until 2010, chevon was not available in our retail stores. This was mainly due to the strong and well-developed informal market for goats (for ritual and religion purposes) with the result that a small percentage of goats are slaughtered in registered abattoirs, the supplier of meat to the retail sector.

Live goats are realising good prices in the informal market and that is why producers consider supplying local market before they think of the export market.
Boer goats are marketed through out of hand sales to speculators, auctions and sales to abattoirs. The biggest percentage of Boer goats is marketed through traders and/or speculators.

4. MARKETING CAMPAIGN

An extensive campaign to educate the consumer about chevon was undertaken by a private company in 2004. Kalahari Kid succeeded by placing chevon on the shelves of a number of supermarkets in South Africa (Pick & Pay, Checkers Hypermarket and Spar). Consumers were made aware of the excellent qualities of chevon. Shoprite Checkers is marketing chevon, branded CHEVON. Chevon is booming in the Western Cape. One of the largest supermarket groups market high quality chevon as a new health meat. Kalahari Kid markets chevon as totally natural with no growth hormones being used. The animals roam and graze freely and are marketed as all-natural South African goat products (NAMC).

The following local market sectors have been identified by Kalahari Kid Corporation (KKC):

1. Adventurous Consumer
   - Usually forming part of the A and B income market.
   - This consumer is adventurous to try out new market trends including the emphasis on quality and health value.
   - The exclusivity of the product is the attraction and should be available in an exciting range of value added and pre-prepared products with designer packaging and innovative recipes.

2. Muslim and Hindu Consumer – local
   - Traditional chevon consumers need to be made aware of the availability of Kalahari Kid Chevon in the market place.
   - The Hindu consumer is not adverse to goat and lamb being slaughtered in the Halaal method and this is the reason for combining the two religious groups together.

3. The C, D lower income groups
   - Traditionally the largest consumers of chevon in South Africa.
   - Used as a daily source of protein and extensively for weddings and funerals.
   - Unfortunately, this consumer group cannot normally afford to purchase a whole carcass. KKC can easily penetrate this market by offering the lower priced cuts of meat, such as neck and breast and flap in a boxed format into the informal sector.
   - Offal is largely consumed in this sector and is normally in short supply in the winter months.

5. INDUSTRY STRUCTURES

The South African Boer Goat Breeders' Association (SABGBA) was established in 1959 to improve and protect the interests of the Boer goat farmers and to introduce a uniform breeding policy and selection criteria.

Indigenous goat structures are not organized in the form of provincial and national structures. There are however several initiatives occurring in the Eastern Cape, Limpopo, North West and Northern Cape provinces...
which aim to provide the organizational, institutional and infrastructural framework within which emerging farmers will more readily be able to market their goats in an organized manner.

In the Northern Cape, regional offices are being created to assist with collection and transport to central infrastructures. Thus far, these “hubs” are private individuals / entrepreneurs, and also encompass an element of job-creation. Over 90 goat co-operatives are currently being formed in the Northern Cape (NAMC).

6. **EMPOWERMENT PROJECTS**

- **Kalahari Kid Corporation**

  The Kalahari Kid Corporation is a joint initiative between private sector, the Northern Cape Provincial Government and emerging farmers in the Northern and Eastern Cape and the North West Province of South Africa. Kalahari Kid has contract growers (farmers who farm with goats, solely for resale to the Kalahari Kid Corporation). The Corporation also sources the goats for slaughter, consolidates them in groups and sends them to one of three nominated abattoirs situated in Groblershoop, Colesburg and Port Elizabeth.

- **Umzimvubu Goats**

  The Umzimvubu Goat Production and Processing facility entails the construction of infrastructure and the training and organisation of goat owners/farmers in the Alfred Nzo district of the Eastern Cape Province. The infrastructure will consist of a feedlot, abattoir, tannery, restaurant, curio shop and leather craft workshop. All the raw products will be sourced from goats owned by ± 3 200 small-scale rural farmers in the Alfred Nzo district.

- **Kgalagadi Dipudi – Cross-border Project - Northern Cape/North West Province**

  The Kgalagadi Dipudi Project involves the formation of Goat Interest Groups, and the training and facilitation of these groups by a group of extension officers from the Northern Cape and North West Province and officers of the Northern Cape Office of the Status of Women known as Metswedi (the fountain). There are currently 43 goat interest groups and they have successfully organised themselves into a cooperative known as the Kgalagadi Dipudi Enterprise (KDE).

- **Boer Goat Farming in North West province**

  The Ngaka Modiri Molema District Municipality in the Northwest Province of South Africa handed over 103 Boer Goats to beneficiaries of a land reform project near Sannieshof. The 10 beneficiaries of the goat section of the project took delivery of the Boer Goats in March 2009.

7. **OPPORTUNITIES**

Commercialization of chevon production, by increasing the percentage slaughtered in the formal sector has the potential to increase income generated from goats. More attention should be given to the promotion of chevon and market development to increase consumer demand and to encourage stock farmers to farm with goats rather than just to keep them.
Chevon demand exceeds supplies in most parts of the world, notably in the tropics and the subtropics, where 74% of the world’s chevon is produced. In Southern Africa lamb and mutton enjoy premium prices while chevon is a secondary product. Discrimination of chevon arises when sheep and cattle are dominant sources of red meat.

Chevon is between 50-60% lower in fat than beef but has the same protein content. Chevon is also lower in fat than chicken. Substituting goats for cows in milk production can increase the goat contribution to animal production in RSA, particularly with the communal farmers. Better use can be made of scarce resources in developing areas because of potential higher fertility of goats and higher feed conversion in relation to body mass for meat and milk production. Compared to cattle, goats produce more milk on less food and are not adversely affected by declining veld conditions. Products made from goats’ milk can be explored.

Goats can tolerate the extremes of desert conditions and high temperature humidity conditions because of their small size. Being an important nutrient source chevon should be promoted in developing countries like South Africa.

8. CONSTRAINTS

Despite certain favourable carcass characteristics such as lower fat percentage compared to beef and mutton, as well as favourable meat to bone ratio, per capita chevon consumption in South Africa is low compared to other red meat types. Chevon seemed to be preferred by a few specific communities in South Africa, but generally has a hard time competing for a market share. It has received little attention in terms of marketing and unfortunately has a negative connection of an undesirable odour. Indications are that the “undesirable odour” only refers to the elderly bucks (NAMC).

Small-scale farmers do not see goats as a saleable commodity. They see them as financial security. There is a perception that goats are a poor man’s animals. This mindset of the farmers has to be changed through an educational approach, promoting the financial value of the animals.

There are reasons why many people do not eat chevon and some of them are as follows:

- Chevon smells
- Beef and mutton are more tasty
- The meat fibre of chevon are too coarse
- Goats are only used in traditional ceremonies
- Goats are pets so should not be consumed

A major constraint is heart water. Many goat improvement schemes collapsed because of heart water. A continuous problem of overgrazing is being experienced. Farmers should be encouraged to sell more goats so this problem can be contained.

9. MARKET INTELLIGENCE

9.1. EXPORT TARIFFS OF GOAT MEAT

Table 1 shows tariffs faced by countries importing chevon originating from South Africa in 2015 and 2016. Table 1 indicates that export tariffs of chevon in Seychelles are the highest at 15% general tariff. Lesotho applied the import tariff of 0% under Intra SACU rate to chevon originating from South Africa. Lastly, Namibia provided South Africa a 0% preferential tariff for exporting chevon meat in 2015 and 2016.
Table 1: Export tariffs of chevon (HS: 0204500)

9.2. IMPORT TARIFFS OF GOAT MEAT

Tariffs that South Africa applied to imports of chevon originating from all possible countries in 2016 are shown on Table 2.

Table 2: Import tariffs of chevon

Table 2 clearly indicates that South Africa is charging 40% or 200c/kg tariff rate to all its trading partners (EU, EFTA, SADC and MERCUSOR) on goat meat imports. However, South Africa applied a duty free rate on chevon imports coming from SADC countries. Noteworthy is the fact that there were no chevon imports in 2016.

9.3. Non-Tariff Barriers (NTBs)

The following discussion about NTBs deals with the European Union’ (EU) standards. The reason for this approach is that the EU applies stringent NTBs to imported meat. Therefore, by implication, if an exporter can satisfy the EU’s regulations, his/her meat product is of the mandated standard to potentially satisfy other countries’ NTBs.

Imports of fresh meat and meat products into the European Union are subject to veterinary certification – which is based on the recognition of the competent authority of the non-EU country by the Directorate-General for Health and Consumer Protection. This formal recognition of the reliability of the competent authority is a prerequisite for the country to be eligible and authorized for export to the European Union. Legally legitimate and adequately empowered authorities in the exporting country must ensure credible inspection and controls.
throughout the production chain, which cover all relevant aspects of hygiene, animal health and public health. All bilateral negotiations and other relevant dialogue concerning imports of meat and meat products must be undertaken by the national competent veterinary authority. All other interested parties and private businesses should contact their competent authority and communicate with the European Union via this channel.

9.3.1. Specific Key Elements

For meat and meat products from all species, countries of origin must be on a positive list of eligible countries for the relevant product. The eligibility criteria are:

- Exporting countries must have a competent veterinary authority which is responsible throughout the food chain. The Authorities must be empowered, structured and resourced to implement effective inspection and guarantee credible certification of the relevant veterinary and general hygiene conditions.

- The country or region of origin must fulfil the relevant animal health standards. This implies that the country should be a member of the World Organisation for Animal Health (OIE) and should meet that organisation’s standards and reporting obligations. Adequate veterinary services must ensure effective enforcement of all necessary health controls.

- The national authorities must also guarantee that the relevant hygiene and public health requirements are met. The hygiene legislation contains specific requirements on the structure of establishments, equipment and operational processes for slaughter, cutting, storage and handling of meat. These provisions are aimed at ensuring high standards and at preventing any contamination of the product during processing.

- A monitoring system must be in place to verify compliance with EU requirements on residues of veterinary medicines, pesticides and contaminants.

- A suitable monitoring programme must be designed by the competent authority and submitted to the European Commission for initial approval and yearly renewal.

- Imports are only authorised from approved establishments (e.g. slaughterhouses, cutting plants, game handling establishments, cold stores, meat processing plants), which have been inspected by the competent authority of the exporting country and found to meet EU requirements. The authority provides the necessary guarantees and is obliged to carry out regular inspections.

- For the import of meat from bovine, ovine or caprine animal species (cattle, sheep and goats), exporting countries have to apply for determination of their BSE status. This status is based on a risk assessment and is linked to specific BSE-related import conditions.

- An inspection by the Commission’s Food and Veterinary Office is necessary to confirm compliance with the above requirements. Such an inspection mission is the basis of establishing confidence between the EU Commission and the competent authority of the exporting country.

9.3.2. Carcasses and offal of sheep and goats are to undergo the following post-mortem inspection procedures:

- Visual inspection of the head after flaying and, in the event of doubt, examination of the throat, mouth, tongue and retropharyngeal and parotid lymph nodes. Without prejudice to animal-health rules, these
examinations are not necessary if the competent authority is able to guarantee that the head, including the tongue and the brains, will be excluded from human consumption;

- Visual inspection of the lungs, trachea and oesophagus; palpation of the lungs and the bronchial and mediastinal lymph nodes (Lnn. bifucationes, eparteriales and mediastinales); in the event of doubt, these organs and lymph nodes must be incised and examined;

- Visual inspection of the pericardium and heart; in the event of doubt, the heart must be incised and examined;

- Visual inspection of the diaphragm;

- Visual inspection of the liver and the hepatic and pancreatic lymph nodes, (Lnn portales); palpation of the liver and its lymph nodes; incision of the gastric surface of the liver to examine the bile ducts;

- Visual inspection of the gastro-intestinal tract, the mesentery and the gastric and mesenteric lymph nodes (Lnn. gastrici, mesenterici, craniales and caudales);

- Visual inspection and, if necessary, palpation of the spleen;

- Visual inspection of the kidneys; incision, if necessary, of the kidneys and the renal lymph nodes (Lnn. renales);

- Visual inspection of the pleura and peritoneum;

- Visual inspection of the genital organs (except for the penis, if already discarded);

- Visual inspection of the udder and its lymph nodes;

- Visual inspection and palpation of the umbilical region and joints of young animals. In the event of doubt, the umbilical region must be incised and the joints opened; the synovial fluid must be examined.

The full details concerning specific requirements are detailed in the documents listed below.

10. PERFORMANCE OF SOUTH AFRICAN CHEVON INDUSTRY IN 2016

Source: ITC calculations based on COMTRADE statistics
In 2016, South Africa's exports represented 0.1% of Chevon (fresh, chilled or frozen) and its ranking in world's exports was 24. Table 3 shows that during 2016, South Africa exported a total of 43 tons of chevon at an average value of US$4,302/unit. Lesotho is the leading importer of chevon, accounting for 74% of South Africa's export market of chevon in 2016. Seychelles accounted for 14.6% during the same period. South African chevon exports to the world increased by 12% in value and by 3% in quantity per annum between the periods 2012 and 2016. Exports of South African chevon to the world have increased by 16% in value between 2015 and 2016.

Growth in demand for South African chevon in 2016 is depicted in Figure 16. The figure shows that South Africa's exports to Lesotho were growing at a lesser rate than its imports from the rest of the world. However, Lesotho has shown a gain of 14% per annum in the dynamic markets of South African exports for chevon meat.

Figure 17 below shows the prospects for market diversification for exports of chevon meat by South Africa in 2016. If South Africa wishes to diversify the imports of meat of goat, the biggest market exist in the Republic of Korea, which has an annual import growth of 26% and a world share of 3.15%. South Africa can also develop a new market in the USA.

Table 4 shows the trade indicators of markets that supplied South Africa with meat of chevon during 2016. According to Table 4, there were no imports of chevon meat by South Africa in 2016.

Figure 18 shows the prospects for diversification of suppliers for meat of goat fresh, chilled or frozen imports by South Africa in 2016. If South Africa is to diversify its meat of sheep or goat fresh, chilled or frozen imports, Australia will be the possible market because its world exports share is 45.55% and annual export growth is 3%. Ethiopia is the second attractive market with world export market share of 28.33% and its annual export growth is 14%.
